# WEB DEVELOPMENT ACTIVITY-BASED LEARNING

## Three Responsive Website Projects

**Student Name:** Lingam Sasank Venkat

**Roll Number:** 26000938

**Branch:** CSM **Section:** 2

Selected case studies: Personal Portfolio Website, Online Learning Platform Interface, and Bakery and Cake Shop Website.

Technologies: HTML5, CSS3, and JavaScript.

Prepared as a Web Development Activity-Based Learning project.

## 1. Personal Portfolio Website

**Website name:** Sasank's Portfolio

**Objective:** Create a personal website that presents a student's profile, education, technical skills, projects, and contact details.

**Features implemented:** Responsive navigation, introduction banner, about section, skill cards and progress bars, project cards, and a demo contact form with JavaScript feedback.

**Files:** Case-Study-1-Portfolio/index.html, style.css, script.js

Screenshot to insert: Open the portfolio webpage in a browser and capture the homepage and one lower section (skills/projects/contact).

## 2. Online Learning Platform Interface

**Website name:** LearnHub

**Objective:** Present online courses with categories, course descriptions, lesson counts, sample ratings, instructor profiles, and course-selection controls.

**Features implemented:** Responsive course cards, category filters, mobile navigation, learning steps, instructor cards, and demo course-selection feedback.

**Files:** Case-Study-2-LearnHub/index.html, style.css, script.js

Screenshot to insert: Capture the hero section and the course grid after trying a category filter.

## 3. Bakery and Cake Shop Website

**Website name:** Sweet Crumbs

**Objective:** Showcase bakery products, sample prices, special offers, shop information, and an enquiry form.

**Features implemented:** Product image cards, category filters, add-to-basket buttons, running item count and total, custom-cake enquiry form, and responsive navigation.

**Files:** Case-Study-3-Sweet-Crumbs/index.html, style.css, script.js

Screenshot to insert: Capture the homepage, product menu, and basket after adding one or more items.

## Implementation and Testing

• HTML5 structures the content using semantic sections, headings, forms, buttons, and navigation.

• CSS3 provides layouts, color themes, cards, transitions, and media queries for mobile screens.

• JavaScript implements mobile navigation, course/product category filters, demo form feedback, and basket calculations.

• Test each site by opening its index.html file in a modern browser, resizing the browser window, and trying the interactive buttons.

• External images and fonts require an internet connection. If an image does not load, check the connection or replace the image URL with a local image.

## GitHub Submission Checklist

■ Create a GitHub repository named WD-Activity-Based-Learning.

■ Upload README.md, all three case-study folders, and Final-Report.pdf.

■ Open all three websites and take genuine screenshots. Add them to the report or a Screenshots folder.

■ Check that your name, roll number, branch, and section are correct.

■ Copy the repository URL and submit it to the faculty/lab mentor according to the instructions.

**Academic note:** This PDF is a report template with project descriptions and screenshot instructions. It does not contain browser screenshots because screenshots should be captured after opening the websites on your computer. The forms, prices, ratings, and ordering/enrollment features are demonstrations, not connected to live services.
